### ref. Dr. Gallo's proof of Dr. Montagnier's HIV retrovirus

Original documents from the National Cancer Institute, which the journalist Janine Roberts made accessible at <http://www.fearoftheinvisible.com/> a year ago, confirm the statements of experts like Kary B. Mullis (Nobel prize winner and inventor of the PCR technique), Etienne de Harven (retrovirus specialist), Eleni Eleopulos (cell biologist at the Royal Hospital Perth) and Heinrich Kremer (founder of cell symbiosis therapy), that neither Robert Gallo and his team nor Jean Luc Montagnier and his team did fulfil for their alleged approval of the HIV-retrovirus any of the criteria for retrovirus-approval, that Montagnier and others had defined in 1972. These rules included: electron microscope photos of the material purified by means of ultra centrifugation from the cell cultures, EM-photos of the thereby won virus-particles and accordingly demonstration of the proteins of the particle wall and of the enzyme proteins and nucleic acids characterising retroviruses from the inside of the particles respectively approval in a new cell culture, that cells infected by these particles, build out particles of the same size and morphology, as they occurred earlier from budding out of cells suspected to contain retroviruses by comparing of the made EM-photos.

So, Gallo and Montagnier and their teams declared, without conducting purification, that all proteins from their cell cultures that had settled at a density gradient of 1.16 gm/ml in sugar solution, are HIV proteins and then used them for the elaboration of the HIV tests (ELISA and Western Blot). The EM photo of the LAV-retrovirus from the Pasteur Institute (from 1983), which the Nobel prize committee published last year on the occasion of awarding the prize to Jean Luc Montagnier and Françoise Barré Sinoussi, showed therefore nothing more than a cultivation of particles from impure cell materials <http://www.fearoftheinvisible.com/nobel>. Jean Luc Montagnier acknowledged in an interview in 1997 that "we didn't purify the virus, whether Gallo did, I don't know" but adhered to the fact that he had seen the HI retrovirus in his mind's eyes assembling their four unspecified characteristics.  
<http://www.virusmyth.com/aids/hiv/dtinterviewlm.htm>

The original documents from March 1984, accessible today, show that the Dr. Mikulas Popvic had cultured his cells with cell material from the Pasteur Institute that contained umbilical cells and had stimulated the cell culture by the addition of chemical T-cell growth factors (TCGF) and other heavily oxidative substances that trigger cell stress and as a result reverse transcriptase activity and the growth of

stress proteins. After sending this T-cell material for examination to Dr. Mathew Gonda, the electron microscopist of the Gallo team, the latter came to the conclusion that "the particles discovered were too small to come from a retrovirus, that such particles could be found in any cell pellets and that he didn't believe that any of the particles photographed were HTLV I, II or III" (later termed as HIV).

<http://www.fearoftheinvisible.com/fraud-in-key-hiv-research-background> .

(That Dr. Montagnier did not hear about the results of this examination of his material is not credible.)

In his draft for the first of four preannounced articles on the proof of HTLV III (later termed HIV) to be submitted to *Science* at the end of March 1984, Dr. Popovic disclosed that he had succeeded in "inducing temporarily signals for reverse transcriptase (termed as spikes) in T lymph cells" from his cell-culture and that he hoped "to be able to extract more from this material so as to analyze it more closely" and concluded that he could not find in his research a retrovirus that could cause AIDS. These clear statements were then crossed out by Dr. Gallo who first saw this draft on his return from Paris, where he had studied the laboratory methods applied at the Pasteur Institute, and then replaced them by the statement that they had obtained "proof of a retrovirus that is probably responsible for AIDS".

<http://www.fearoftheinvisible.com/fraud-in-key-hiv-research-background>

The Pasteur Institute, according to its own information, used since 1983 umbilical cells of a healthy mother with a healthy child for its cell cultures. Umbilical cells, which were used at various times in experiments for proving retroviruses, are similarly to stem cells, immortal and form telomerases (reverse transcriptase enzymes). With their help both the Montagnier and Gallo team wanted to substantiate a new retrovirus and develop the test substrate for a blood test as proof of this retrovirus for which both institutions had filed patent applications already in 1983. However, neither of the teams succeeded in approving reverse transcriptase and sufficient supplies of substrate for such a blood test. On studying the laboratory methods at the Pasteur Institute in early March 1984, Dr. Gallo must have come up with the bright idea of incubating T lymph cells with leukemic cells, which are also immortal and produce high amounts of telomerases (enzymes of reverse transcriptase) thus producing sufficient supplies of substrate for such blood tests. Correspondingly he then incubated the cells of US AIDS patients with HUT 78 cells (leukemic cells) and as a result obtained the patent for the production of a blood test while the patent application from the Pasteur Institute was rejected. The dispute between Jean Luc Montagnier and Robert Gallo over the "discovery of the HI-retroviruses" was eventually settled in that each received 1% of the earnings from the HIV tests and that Jean Luc Montagnier was elected to the presidency of the World AIDS Foundation and in the subsequent years decided which relief and research projects were to receive the gains from the remaining 98% of the profits from the tests.

At the AIDS Conference in New York in June 1983 at which retrovirus researchers mainly presented papers on the (at the time very rare) appearance of Kaposi's sarcoma, he must have realized that both the experts and the general public, prepared by leading media representatives for a new, infectious and deadly plague, would accept a new immune deficiency retrovirus and the corresponding tests. After he and other retrovirus researchers had failed in the attempt to provide evidence of a cancer-retrovirus and with the danger of losing financial support from the war on

cancer program, started by Richard Nixon, Dr. Thomas from the New York Sloan Kettering Cancer Center said to the conference that the cause of AIDS must be a new virus and that the concerning questions must be resolved by human experiments in which cellular immunity reactions must be suppressed. By means of the test substrate, infected blood and carriers of this new retrovirus, that was supposed to be transmitted via blood, sperm and other bodily fluids, were detected. As these tests measure antibodies against non-defined cell proteins their sensitivity had to be regulated in a number of stages so that finally predominantly indicated people with chronically stressed immune systems (promiscuous homosexuals with frequent antibiotic/popper consumption, intravenous drug users and people with blood disorders) showed a positive result. However, there were cross-reactions in these tests, with antibodies against TB bacteria, PCP fungi, Candida fungi etc. People with positive test results were then, within the terms of the suggested human experiments, treated with substances like AZT, which suppress cellular immunity reactions. Not until 1997, 14 years after the supposed discovery of HIV and 12 years after the introduction of antibody tests, EM controls of the proteins settling at the 1.16 gm/ml gradient were carried out with the result, that only cell debris of varying size from the human cell culture could be found. Nevertheless all HIV tests and the definitions arising from them like "HIV particle", "Hi viral load", "HIV proteins" etc. are until today based on antibodies against arbitrarily selected proteins from the cell walls and cell skeletons which are released in higher amounts in ongoing inflammatory reactions of a variety of causes.

[http://www.ummafrapp.de/skandal/heinrich/Kremer\\_The\\_Collective\\_Tunnel\\_Vision.pdf](http://www.ummafrapp.de/skandal/heinrich/Kremer_The_Collective_Tunnel_Vision.pdf)

The HIV verification test (Western Blot) in the USA and Europe was adjusted differently for Africa and Asia, where for the estimates of the WHO many people even without testing were reported as AIDS cases and through an extension of the definition of AIDS defining illnesses to 29 infectious and non-infectious indicator diseases (including TB, Candidiasis, Cryptococcosis, Toxoplasmosis, Micobacterium avium, Herpes simplex, Leishmania and Salmonella septicaemia) HIV should be approved as being responsible for the serious course of all of these diseases.

<http://ummafrapp.de/skandal/versch.%20Texte/Johnson%20HIV%20positive%20It%20depends%20where%20you%20live-1.pdf>

Low T 4 cell counts that were measured in the plasma of AIDS patients led to the conclusion that HI-viruses kill T 4 helper cells thus triggering AIDS. How exactly the HI viruses kill the T 4 cells could to this day not be demonstrated. In an article in the *Journal of the American Medical Association* (JAMA) published at the end of 2007, Beningo Rodriguez et al reported that HI viruses could only kill at the very most 4-6% of T 4 cells - too few to cause AIDS – and that the T 4 cell counts and the so-called viral load do not provide reliable information about the existing defence capabilities and the further course of the diseases in AIDS patients

<http://ummafrapp.de/skandal/haart/annex%204.pdf>. (The test by which this would be possible – the DTH test in which the spontaneous skin reaction to a series of antigens is measured– was blocked worldwide in the course of trials with an HIV vaccine by the patent holder Aventis-Mérieux-Pasteur.)

On the basis of Gallo's and Montagnier's HIV-AIDS hypothesis, HIV positives tested persons "as carriers of an infectious, lethal retrovirus", were treated from 1985 on with seriously damaging cell toxins (nucleoside analogs like AZT) intended to kill all

cells in the organism that were infected with these retroviruses and thereby leading within short time to the death of thousands of patients. This therapy was replaced in 1996 by the HAART therapy in which the dosage of cell-killing substances was reduced and substituted by protease inhibitors which slow down for a some time the inflammatory reactions. (This treatment also causes via damage to mitochondria damage to the brain, the liver, the heart and other organs.)

[http://ummafrapp.de/skandal/felix/antibiotics/appendix3\\_haart\\_and\\_the\\_mitochondria.pdf](http://ummafrapp.de/skandal/felix/antibiotics/appendix3_haart_and_the_mitochondria.pdf) Since 1985 billions of dollars have been earned every year by international pharmaceutical companies from these antiviral AIDS drugs and the corresponding tests and at the same time more public money has been spent on HIV research than on cancer research.

While Dr. Gallo still contests manipulations made in his laboratory when seeking proof of HIV and in the development of the HIV tests, which have become the subject of five investigations by commissions of the NIH and the US-Congress between 1990 and 1995 <http://fearoftheinvisible.com/moredocs>, Jean Luc Montagnier has left himself an escape route in relation to his retrovirus. He stated at his presentation to the awarding of the Nobel Prize that the "characteristics" belonging to the HI-retrovirus only appear under the condition of nowadays occurring "atmospheric and food pollution, favorising oxidative stress and immune system depression", and pointed out in interviews the importance of herbal antioxidants and stated that "people with a healthy immune system can eliminate HI-viruses within 24 hours."

[http://nobelprize.org/nobel\\_prizes/medicine/laureates/2008/montagnier\\_slides.pdf](http://nobelprize.org/nobel_prizes/medicine/laureates/2008/montagnier_slides.pdf)

The Nobel Price Committee until today has not responded to the questions about his studies which have been submitted to it by Eleni Eleopoulos (Perth Group).

<http://www.theperthgroup.com/montagniernobel.html>.

25 years after the alleged approval of the HIV-Retrovirus, dissidents from all over the world have come together in Oakland (USA) to discuss the real causes of AIDS-defining illnesses and the validity of the administrated tests <http://ra2009.org>. Before the conference took place, big media concerns such as Newsweek and organized groups at US-universities launched a campaign against its participants by naming them "AIDS-denialists" trying to evoke similarities with the Holocaust denialists.
